In the Claims:

Kindly amend the claims as follows:

1-4. (Canceled)

5. (Currently amended) Method for manufacturing components made in one piece, which appear in a weaving machine, comprising one or more first and second parts, said parts being manufactured in separate first and second parts and being joined together to form a whole by means of processes which practically do not change the cross-section of said parts, wherein said first and second parts have:

- different mechanical and/or magnetic and/or tribological properties; and/or
- a different manufacturing method; and/or
- different shape properties

according to their functional requirements in the component, wherein said component is a hook (1b), comprising:

- a first part (4a) consisting of a stamped piece of material, which may be covered by injection moulding;
- a second part (4d) jointed to the first part and consisting of a flat piece of material having adequate magnetic properties, so that it may be influenced by a magnetic selector;
- a third part (4b) jointed to the second part and consisting of a stamped piece of spring steel;
- a fourth part (3) jointed to the third part and consisting of a flat piece of material available on the market; and

- a fifth part (4c) joined to the fourth part and consisting of a stamped piece of material.

6. (Previously Presented) Method for manufacturing components made in one piece, which appear in a weaving machine, comprising one or more first and second parts, said parts being manufactured in separate first and second parts and being joined together to form a whole by means of processes which practically do not change the cross-section of said parts, wherein said first and second parts have:

- different mechanical and/or magnetic and/or tribological properties; and/or
- a different manufacturing method; and/or
- different shape properties

according to their functional requirements in the component, wherein said component is a lancet, comprising:

- a first part, consisting of a stamped piece of material having an appropriate shape;
- a second part consisting of a strip having a cross-section corresponding to that of flat steel; and
- a third part, consisting of a stamped piece of material, designed to be fixed in a lancet holder.

7. (Previously Presented) Method for manufacturing components made in one piece, which appear in a weaving machine, comprising one or more first and second parts, said parts being manufactured in separate first and second parts and being joined together to form a whole by means of processes which practically

do not change the cross-section of said parts, wherein said first and second parts have:

- different mechanical and/or magnetic and/or tribological properties; and/or
- a different manufacturing method; and/or
- different shape properties

according to their functional requirements in the component, wherein said component is a heddle (10b), comprising:

- a first part (13a) made of wire material or flat steel;
- a second part (14) consisting of a stamped piece of material; and
- a third part (13b) made of wire material.

8. (Previously Presented) Method according to claim 7, wherein said second part at one of its two sides ends in a cylindrical extremity having the same diameter as the wire material of the first (13a) and/or the third part (13b).
